XML

Download notebook

Simple example from http://software-carpentry.org/3_0/xml.html

XML files are best viewed as trees

Very common structured data format, supporting hierarchical, nested data with metadata.

Recommended libraries:

- lxml (Performance)
- untangle (Simplicity)

\$ pip install untangle

untangle

Example data is an XML file with information about outages on escalators and elevators in the New York subway system

```
In [1]: xml file = "nyct ene.xml"
 In [2]: import untangle
 In [3]: doc = untangle.parse(xml file)
 In [4]: doc.get_elements()
 Out[4]: [Element(name = NYCOutages, attributes = {}, cdata = )]
 In [5]: doc.
             File "<ipython-input-5-baa82b978199>", line 1
               doc.
           SyntaxError: invalid syntax
 In [6]: outages = doc.NYCOutages.outage
 In [7]: len(outages)
 Out[7]: 38
 In [8]: outage = outages[5]
 In [9]: outage.get elements()
 Out[9]: [Element(name = station, attributes = {}, cdata = 181 ST STATION),
            Element(name = borough, attributes = {}, cdata = MN),
            Element(name = trainno, attributes = {}, cdata = 1),
Element(name = equipment, attributes = {}, cdata = EL110),
            Element(name = equipmenttype, attributes = {}, cdata = EL),
Element(name = serving, attributes = {}, cdata = LOWER MEZZANINE TO UPPER MEZZANINE),
            Element(name = ADA, attributes = {}, cdata = N),
            Element(name = outagedate, attributes = {}, cdata = 12/27/2012 8:07:00 AM),
            Element(name = estimatedreturntoservice, attributes = {}, cdata = 12/29/2012 12:00:00 AM),
            Element(name = reason, attributes = {}, cdata = REPAIR),
            Element(name = isupcomingoutage, attributes = \{\}, cdata = \mathbb{N}),
            Element(name = ismaintenanceoutage, attributes = {}, cdata = N)]
In [10]: outage.estimatedreturntoservice.cdata
Out[10]: u'12/29/2012 12:00:00 AM'
```

CSV

Means a file where data just have some sort of separator

Example, small sample of http://a841-dotweb01.nyc.gov/datafeeds/ParkingReg/signs.CSV (88 MB)

```
In [11]: %%bash
         head thousand_signs.csv
          B,P-004958,1,0000 ,
                                 ,Curb Line
                               ,Property Line
          B,P-004958,2,0009 ,
                                 , NIGHT REGULATION (MOON & STARS SYMBOLS) NO PARKING (SANITATION BROOM SYMBOL) MIDNIGHT TO 3AM TUES
          B,P-004958,3,0030 ,
          & FRI <--> (SUPERSEDED BY SP-841C)
          B,P-004958,4,0030 , ,1 HOUR PARKING 9AM-7PM EXCEPT SUNDAY
                                 ,NIGHT REGULATION (MOON & STARS SYMBOLS) NO PARKING (SANITATION BROOM SYMBOL) MIDNIGHT TO 3AM TUES
          B,P-004958,5,0208
          & FRI <--> (SUPERSEDED BY SP-841C)
          B,P-004958,6,0208 ,
                                 ,1 HOUR PARKING 9AM-7PM EXCEPT SUNDAY
          B,P-004958,7,0218,
B,P-004958,8,0232,
                                 ,Property Line
                                 ,Curb Line
```

```
B,P-009318,1,0000 , ,Curb Line
B,P-009318,2,0014 , ,Building Line
```

Builtin module csv

Primary documentation: http://docs.python.org/2.7/library/csv.html

```
In [12]: # Simple reading
           f = open("thousand_signs.csv", "r")
          for _ in range(3):
               print(repr(f.readline()))
           'B,P-004958,1,0000 ,
                                     ,Curb Line\r\n
                                    ,Property Line\r\n'
           'B,P-004958,2,0009 ,
           'B,P-004958,3,0030 ,
                                     ,NIGHT REGULATION (MOON & STARS SYMBOLS) NO PARKING (SANITATION BROOM SYMBOL) MIDNIGHT TO 3AM TUES
           & FRI <--> (SUPERSEDED BY SP-841C)
                                                                                           \r\n
In [13]: import csv
In [14]: # Using a CSV reader
          f.seek(0)
          reader = csv.reader(f)
          reader
Out[14]: <_csv.reader at 0x1084d54b0>
In [15]: for _ in range(3):
               print(repr(reader.next()))
           ['B', 'P-004958', '1', '0000 ', ' ', 'Curb Line']
['B', 'P-004958', '2', '0009 ', ' ', 'Property Line']
['B', 'P-004958', '3', '0030 ', ' ', 'NIGHT REGULATION (MOON & STARS SYMBOLS) NO PARKING (SANITATION BROOM SYMBOL)
           MIDNIGHT TO 3AM TUES & FRI <--> (SUPERSEDED BY SP-841C)
                                                                                                                    ']
In [16]: f.close()
```

Rows are split in to lists based on the seperator on the fly

Dialects

There's no clear standard for the which characters are used for separation of columns and rows.

The specific setting of formatting is called a dialect

```
In [17]: csv.list_dialects()
Out[17]: ['excel-tab', 'excel']
```

 ${\tt excel-tab}$ uses ${\tt \t}$ for column separations

If we want to separate fields which internally uses , , we could for example use ; as a separator.

```
In [18]: %%bash
          head example.csv
           chapter; pages with footnotes; pages with references
           1; 5,6; 1,2,4,5
           2; 8; 7,8,9
           3; 11,12; 10,12,13,14
           4; 16,19; 16,17,20
In [19]: csv.register_dialect("semicolon", delimiter=";", skipinitialspace=True)
          csv.list_dialects()
Out[19]: ['excel-tab', 'excel', 'semicolon']
In [20]: f = open("example.csv", "r")
           reader = csv.reader(f, "semicolon")
           for line in reader:
               print(line)
           f.close()
           ['chapter', 'pages with footnotes', 'pages with references']
           ['1', '5,6', '1,2,4,5']

['2', '8', '7,8,9']

['3', '11,12', '10,12,13,14']

['4', '16,19', '16,17,20']
```

Automatically detecting dialect

```
In [21]: sniffer = csv.Sniffer()
csv.Sniffer analyzes text for patterns, to find the dialect
In [22]: f = open("example.csv", "r")
```

```
In [23]: sample = f.read()
           dialect = sniffer.sniff(sample)
           f.seek(0)
           reader = csv.reader(f, dialect)
           for line in reader:
               print(line)
           f.seek(0)
            ['chapter', 'pages with footnotes', 'pages with references']
['1', '5,6', '1,2,4,5']
['2', '8', '7,8,9']
            ['3', '11,12', '10,12,13,14']
['4', '16,19', '16,17,20']
csv can be very large, reading all of it to find the dialect can be time consuming and not necessary
In [24]: sample = f.read(7) # Read 7 bytes
           print(repr(sample))
           print("")
           f.seek(0)
           dialect = sniffer.sniff(sample)
           reader = csv.reader(f, dialect)
           for line in reader:
                print(line)
           f.seek(0)
            'chapter'
            ['chap', 'er; pages wi', 'h foo', 'no', 'es; pages wi', 'h references']
            ['1; 5,6; 1,2,4,5']
            ['2; 8; 7,8,9']
            ['3; 11,12; 10,12,13,14']
['4; 16,19; 16,17,20']
Undersampling can of course yield erronous dialects
In [25]: sample = f.read(80)
           print(repr(sample))
print("")
           f.seek(0)
           dialect = sniffer.sniff(sample)
           reader = csv.reader(f, dialect)
           for line in reader:
               print(line)
           f.seek(0)
            'chapter; pages with footnotes; pages with references\n1; 5,6; 1,2,4,5\\n2; 8; 7,8,9'
            ['chapter', 'pages with footnotes', 'pages with references']
['1', '5,6', '1,2,4,5']
['2', '8', '7,8,9']
['3', '11,12', '10,12,13,14']
['4', '16,19', '16,17,20']
For larger files, around 1024 bytes is quite good, you want to have a few lines in the samples
In [26]: dialect.delimiter, dialect.lineterminator, dialect.skipinitialspace
Out[26]: (';', '\r\n', True)
In [27]: sniffer.has_header(sample)
Out[27]: True
In [28]: f.close()
In [29]: f = open("thousand_signs.csv", "r")
           sample = f.read(100)
           sniffer.has_header(sample)
Out[29]: False
```

JSON

Builtin module json

JavaScript Object Notation, human readable serialization of data.

Mostly known from sending data between server and client in web applications

In Python nomenclature, one can say it consists of lists and dictionaries, which can be populated by strings, integers and floats

```
In [30]: %%bash
          # Example from wikipeda page on JSON
         cat example.json
              "firstName": "John",
               "lastName": "Smith",
               "age": 25,
               "address": {
                   "streetAddress": "21 2nd Street",
                   "city": "New York",
"state": "NY",
                   "postalCode": "10021"
               "phoneNumber": [
                       "type": "home",
                       "number": "212 555-1234"
                  },
                       "type": "fax",
                       "number": "646 555-4567"
                   }
              ]
          }
In [31]: import json
In [32]: f = open("example.json", "r")
          json_data = json.load(f)
          f.close()
          ison data
Out[32]: {u'address': {u'city': u'New York',
            u'postalCode': u'10021',
            u'state': u'NY',
            u'streetAddress': u'21 2nd Street'},
           u'age': 25,

           u'lastName': u'Smith',
           u'phoneNumber': [{u'number': u'212 555-1234', u'type': u'home'},
            {u'number': u'646 555-4567', u'type': u'fax'}]}
```

YAML

Package pyyaml, install by pip install pyyaml

Databases

Drivers for popular none-SQL databases:

- pycouchdb
- pymongo

Web services

A common way to make data available is in the form of a web service.

To get data one sends a GET command to a server, which interprets the URI used to send the GET command, and sends back what one asked for.

Python comes with several http libraries, but the recommendation is to install the package requests

(pip install requests)

Documentation on http://docs.python-requests.org/

```
In [33]: import requests
In [34]: r = requests.get("http://ws.spotify.com/search/1/track.json", params={"q": "kaizers orchestra"})

Task

Make a module and script which fetches the XML formatted for the status of escalators in the NYC subway system at http://www.grandcentral.org/developers/data/nyct/nyct_ene.xml, calculate the fraction of those which have the reason "Repair", and prints this fraction.

(Information about the data can be found at http://www.grandcentral.org/developers/download.html)

The script should use the module, and should be installable by python setup.py install

```
[lastname]/
     [lastname]/
     __init__.py
```

```
scripts/
    getting_data.py
README.md
setup.py
```

In setup.py, add the scripts to the call of the setup function. For details, see http://peak.telecommunity.com/DevCenter/setuptools#basic-use

This means that after python setup.py install has been run, it should be possible to simple type

```
$ getting_data.py
```

in the terminal and get the desired output.
